

Creating Presentations

Using Typst and this template

FlixCoder

2023-09-19

Motivation

- The template aims to make it easy to create pretty slides
- Typst is great to use
- Automatic styling of sections/chapters via headings
- `#slide` function for creating slides

How to use

Starting with the template

1. Download or copy the `metadata.typ` and `template.typ` files to your project.
2. Adjust the metadata in the `metadata.typ` file to your needs.
3. Create a `slides.typ` or similar with the following starting content:

```
#import "template.typ": *
#show: doc => slides(doc)
```

Filling in content

Next you can fill in content with headings for sections and slide functions for slides:

= My Section

```
#slide(title: "My Title")[
    My slide content.
]
```

```
#slide()[
    #image("your-image.svg", width: 80%)
]
```

Problems

Problems

- There is no thing similar to \pause sadly, at least I have not found a way to do it
